Introduction

- The doll's simulated skin is made from non-toxic materials with no chemical odor.
- When products are stored for extended periods, oil may appear on the surface. This is due to oils contained in the doll formula and is completely normal. Simply wipe this away gently with a lint-free cloth.
- During use or storage, dust and stains may adhere to the surface. To maintain the body skin's performance and keep the body surface clean, perform regular maintenance.
- Maintenance frequency depends on usage and storage conditions.

Maintenance Methods

① Dip a sponge or cloth in warm water and gently wipe the doll's surface
② For dirt or stains on the body surface, gently clean multiple times with soapy water—do not scrub forcefully
③ Avoid corrosive cleaners such as strong acids, alkaline solutions, powerful disinfectants, or harsh detergents
④ Use mild cleaners: soap, liquid laundry detergent, shampoo, body wash, or gentle cleaning products
⑤ After the surface is completely dry, apply talcum powder using a powder brush

Joint Maintenance

- If the doll's joints remain bent for extended periods, creases and wrinkles will appear on the skin surface due to improper positioning and prolonged pressure.
- For example, if seated in a chair for too long, horizontal lines will appear on the abdomen.
- Sex dolls have resilience properties. When not in use, store the doll in the same position as when delivered to reduce stress on all joints. If wrinkles appear, lay the doll flat for several days—the creases will diminish and disappear.

Makeup and Coating Maintenance

- The factory-applied makeup is a durable coating that typically won't rub off easily.
- **Important:** Do not wipe forcefully, especially makeup on the face, eyebrows, and eyelashes. Use gentle pressure when cleaning.
- Excessive force will remove hair and cause color to fade. Once color is removed, repairs are difficult to perform.
- Standard cosmetics may be used on the doll, such as lipstick and blush. Avoid thick, sticky products that are difficult to clean. Lip gloss is not recommended.
- When changing makeup, do not apply forcefully. Use soapy water or makeup remover and wipe gently.

Storage Environment

Introduction

Proper storage protects your doll and ensures long-term use. A good storage environment prevents skin aging, protects internal components, and significantly extends the doll's lifespan.

Critical Requirements

Always apply baby powder or talcum powder to the skin for protection against oil and dust
Return the doll to its original factory position after use—this posture provides optimal storage protection for the body skin
Alternative: Use a specialist stand and hook system to hang the doll

Storage Guidelines

1. Prevent Prolonged Sun Exposure

   Avoid direct sunlight as body colors may fade after long-term UV exposure.

2. Prevent Dust Accumulation

   The body surface has natural stickiness and static properties that attract dust. When storing, minimize dust exposure to reduce cleaning requirements.

3. Avoid Moisture

   Prevent storage in humid environments as the internal sponge filling will absorb moisture.
   While wiping or bathing with water is acceptable, **never soak the doll in water** for extended periods as this causes permanent damage.
   Warning: Never pour water into the neck area where metal components are located—this will cause permanent damage.
   Once water enters the sponge filling, the doll becomes extremely difficult to dry completely.

4. Prevent Surface Staining

   Never place the doll on artificial leather or dyed leather surfaces for extended periods. Oil-soluble pigments in these materials can transfer and permanently stain the body.
   After contact with such materials for more than 2 hours, serious discoloration may occur that is nearly impossible to remove.

5. Temperature Control

   Maintain storage temperature between 5-35°C (40-95°F).
   Dolls cannot withstand extreme temperatures for extended periods. In winter, electric blankets may be used for warming, but ensure temperatures remain moderate.

6. Prevent Compression

   Avoid compressing the doll during storage as long-term pressure will distort both body and internal sponge components.
   Never place heavy objects on the doll or compress any body parts for extended periods.

7. Maintain Stress-Free Positioning

   Store the doll in an unfolded, natural posture. Extended bending or compression causes cracks and permanent folds in the body.

8. Safety Notice

   This product is not a toy. Keep away from children and prevent access by minors.

Dressing Your Doll

Introduction

Doll limbs have articulated movement within specific ranges. When dressing, follow these guidelines to protect the skin:

1. Use Powder to Prevent Sticking

   The doll surface can be sticky. Apply bath powder, talc, or baby powder before dressing.

2. Respect Movement Limitations

   When dressing, avoid excessive arm twisting that may cause tears. Follow safe angle guidelines and never raise arms directly overhead—this causes underarm tears.

3. Remove Head for Tight Clothing

   When putting on coats or tight garments, remove the doll's head first if clothing is too restrictive.

4. Apply Powder for Tight-Fitting Items

   For tight pants or socks, apply bath powder or talcum powder to legs before dressing to reduce friction.
